

# **«T2 corridor» transit procedure in rail traffic through Switzerland**

## Factsheet for railway undertakings

### **1. What is the «T2 corridor» procedure?**

The «T2 corridor» customs transit procedure makes it possible for goods in free circulation in the EU (Union goods or T2 goods) to be transported between two places located in the EU customs territory through Switzerland by rail, without the T2 customs status of the goods being lost.

### **2. Prerequisites**

To be able to apply the simplified T2 corridor customs procedure, the following conditions must be fulfilled:

- The consignment must be accompanied by one continuous international CIM rail consignment note indicating the station of departure in the EU.  
  
The rail consignment note may not cover any other goods apart from the T2 corridor goods.
- The rail consignment note must be marked «T2 Corridor» (section 99 of the CIM rail consignment note).
- Transport through Switzerland must be monitored by means of an electronic system (cf. section 4).
- The railway undertaking (RU) in Switzerland must be authorised to use the T2 corridor procedure.

The authorisation is granted by means of an agreement between the RU and the Federal Customs Administration (FCA). The agreement specifies the details of the transit procedure in Switzerland, including electronic transport monitoring.

The list of RUs authorised to use the procedure is published on the following website: <http://www.ezv.admin.ch/zollanmeldung/05042/05049/index.html?lang=en>.

### **3. Procedure in the station of departure**

The RU in the country of departure (or the RU that appears as the main carrier) checks which RU will be providing transport through Switzerland (cf. CIM rail consignment note, section 57 «other transport providers / route travelled») and whether or not it is authorised in Switzerland to use the T2 corridor procedure. If it is authorised, then the RU must mark «T2 Corridor» in section 99 of the CIM rail consignment note. In addition, the RU must ensure that the RU travelling in Switzerland has all the consignment data to be able to fully register the corridor consignments in the system of the rail infrastructure operator (cf. section 4).

#### 4. Required data

The FCA monitors consignments in the T2 corridor procedure with the RailControl IT system. RailControl receives the data from the system of SBB Infrastructure (SBB Infra). To this end, the RU must report the consignments to the SBB Infra system with the train notification before crossing the border.

Consignments in the T2 corridor procedure must contain the following information at least for customs purposes:

- Train number;
- Wagon number (in intermodal transport: in addition the container number or the vehicle registration number);
- Full CIM rail consignment note number;
- Procedure code «T2 corridor» (code 2) supplemented with the corridor agreement number of the RU authorised to use the T2 corridor procedure in Switzerland;
- NHM goods number;

The use of NHM collective numbers will be accepted for the time being (NHM 990200 to 990400, 994100 to 994900 and 999800). In addition, the standard trade description of the goods (trade name) must be indicated here in one official language or in English.

- Gross weight of the goods;
- Station of departure;
- Station of destination;
- Station of entry/exit;
- Intermodal transport:
  - Type of the unity (e.g. container)
  - Number of the unity (e.g. number of the container)
  - NHM code contents (e.g. contents of the container)
  - Gross weight of the goods.
